OVERVIEW

The one-screen answer to "is OPTIMUS healthy right now?"

Reads the same live snapshot as every other tab. If a number here disagrees with its own tab, that tab is more detailed.

CONTAINERS

60

31 hermes-mcp-* · 1 sentinel

BRIDGES

2/2

0 failing checks

CLI AUTH

authenticated

shared-broker

QWEN

0

OAuth credential present

HERMES SRC

CONTAINER CENSUS

Where they all come from, by owning compose project.

mcp-servers	31
apviz	24
(none)	2
optimus-minimax	2
dashboard-monitor	1

NEVER run: docker container prune -a (lost the swarm 2026-08-08)

BRIDGE HEALTH

Warn is the normal resting state here; fail is the emergency.

hermes-bridge	`unknown · 0ok / 0w / 0f`
antigravity-bridge	`warn · 8ok / 2w / 0f`

Three warns are expected on a healthy system. The *Bridges* tab explains each.

MINIMAX ECOSYSTEM

Code, Design, and a CLI that is really Code running in node mode.

Code	yes
Design	yes
CLI auth	authenticated
Connector tools	15

Close MiniMax Code and the CLI loses its auth — the two share one identity.

QWEN STATUS

Why a Qwen prompt would fail today, in three lines.

ACP daemon	yes
OAuth credential	MISSING
Ollama	running

Model provider is local Ollama on 127.0.0.1:11434. If Ollama is down, qwen_prompt returns "Connection error". Install Ollama or complete qwen-oauth.

COMPOSE INTEGRITY

The file defining every non-swarm container. It vanished once already.

docker-compose.yml	yes
parses cleanly	yes

Run `cc guard` to check it, and to rebuild it from live state if it ever goes missing again.

HERMES SOURCE

Hermes updates itself, so read this as "now", not as a fact.

version	0.21.5+6666.gaea016e.dirty
modified	8
update lock	absent

8 file(s) modified, no lock held

Popy reserved `hermes update` for himself. Mavis has never run it.
